Videx is offering a Single, Solid Die Single Blow Header with 300 metric tons forging capacity for large diameters.

The machine will head one end and chamfer the other end in one operation, resulting in headed and chamfered parts.

The machine accepts pre-cut slugs, fed into a magazine. It will feed the parts from the magazine into the die, cold forge the head in the punch and chamfer the other end, using a chamfer insert inside the die.

The wire diameter range is 14-30mm with minimum blank length of 65mm before heading and maximum standard blank length of 300mm or longer upon request.

Production rate is 15-18 PPM.

Videx is offering also open die Cold Formers with 1, 2 or 3 heading stations and in tonnage rating from 50 tons and up to 300 tons. A threading station is optional on all models.
